

ABSTRACT OF THE DISCLOSURE

Heat-insulating food container includes an injection-molded container body having a bottom wall, a circumferential wall integrally connected to a periphery of the bottom wall and upwardly extending therefrom for defining an inner space and an upper open end, and straight vertical ribs vertically extending along the circumferential wall. The circumferential wall includes circumferential wall parts having different diameters and arranged to form the circumferential wall with the diameter thereof decreasing in a stepwise manner in a downward direction, thereby forming corresponding stepped portions on an exterior surface and an interior surface of the circumferential wall.
